1 Find the general solution of the differential equation

$$f'(x) + f(x) = xe^x.$$

2 Consider the sequence $(a_n)_{n=1}^{\infty}$ for which $a_0 = 1$ and for all $n > 0$, then nth term is obtained from the previous one by adding $1/n$ to it. So, for example, the first few terms are

$$\begin{aligned} a_0 &= 1 \\ a_1 &= a_0 + \tfrac{1}{1} = 2 \\ a_2 &= a_1 + \tfrac{1}{2} = \tfrac{5}{2} \\ a_3 &= a_2 + \tfrac{1}{3} = \tfrac{17}{6} \\ &\vdots \end{aligned}$$

Determine whether the sequence $(a_n)_{n=1}^{\infty}$ converges.

3 (a) Show that $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converges, using the comparison test.

(b) Find the exact value of $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ by calculating its Nth partial sum and taking a limit of the resulting expression as $N \to \infty$. Hint: check that $\frac{1}{n(n+1)} = \frac{1}{n} - \frac{1}{n+1}$, and then use that identity to write out the first few partial sums, looking for cancellation.

4 Determine the convergence or divergence of each of the following series

(a) $\frac{1}{1} + \frac{1 \cdot 2}{1 \cdot 3} + \frac{1 \cdot 2 \cdot 3}{1 \cdot 3 \cdot 5} + \frac{1 \cdot 2 \cdot 3 \cdot 4}{1 \cdot 3 \cdot 5 \cdot 7} + \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}{1 \cdot 3 \cdot 5 \cdot 7 \cdot 9} + \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6}{1 \cdot 3 \cdot 5 \cdot 7 \cdot 9 \cdot 11} + \cdots$

(b) $\sum_{n=1}^{\infty} \frac{(-1)^n \cos(n\pi)}{\sqrt{n}}$

(c) $\sum_{n=1}^{\infty} (-1)^n \frac{n}{n^2+1}$

(d) $\sum_{n=1}^{\infty} \frac{e^n (n!)^2}{(2n)!}$

5 (a) Suppose that p is a real number. Find the fourth-order Taylor polynomial of $f(x) = (1+x)^p$ centered at $x = 0$. Express your answer in terms of p.

(b) Use your answer to part (a) to find the fourth-order Taylor polynomial of $g(x) = \frac{1}{\sqrt{1-x^2}}$ centered at $x = 0$. (Hint: first find the Taylor series for h where $h(y) = 1/\sqrt{1-y}$ and then substitute $y = x^2$.)

6 Suppose that you get to put plus or minus signs between the following terms *however you wish*:

$$\frac{1}{3} \qquad \frac{1}{9} \qquad \frac{1}{27} \qquad \frac{1}{81} \cdots$$

So if you put all plus signs, you'd get $\frac{1}{3} + \frac{1}{9} + \cdots$. If you put all minus signs, then you'd get $-\frac{1}{3} - \frac{1}{9} - \cdots$. (In addition to these two, there are many, many other ways you could fill in the signs).

(a) Show that the resulting series is absolutely convergent, regardless of your choice of signs.

(b) Show that it is not possible to fill in the signs in such a way that the sum of the resulting series is 0.
